bensahla.com | github.com/abdelrahmanebensahla | linkedin.com/in/abdelrahmanebensahla | jobcannon.app

Full-stack engineer building AI products on TypeScript, Next.js, PostgreSQL, and the Claude API. Built and run a paid AI SaaS with 30 subscribers. Ship production applications used daily by hundreds of users.

PROJECTS

Job Cannon | AI resume-to-job matching SaaS | jobcannon.app

Next.js, TypeScript, Claude API, Stripe, Clerk, Neon, Drizzle, Vercel

- Built, launched, and operate solo; 30 paying subscribers. A two-stage Claude pipeline extracts a typed profile from an uploaded PDF resume, narrows a nightly-scraped job corpus through a deterministic keyword pre-filter, then re-ranks the top matches with per-job reasoning and emails them each weekday.
- Built three Claude tool-use pipelines (profile extraction, job ranking, resume critique) on forced tool calls with Zod schema validation and single-retry error replay, plus an ID-validation guard that rejects hallucinated job references before they reach users.
- Cut inference cost per ranking call by 77%, from \$0.159 to \$0.037, by right-sizing the model and trimming prompt payload 65% after measuring that keyword pre-filter recall depends on full job descriptions while ranking quality does not.
- Diagnosed a silently decaying ingestion pipeline in which 27 of 45 job-board integrations had died unnoticed. Restored coverage to 62/62 by integrating a fourth ATS, grew the corpus from 5.4K to 10.6K roles across 345 companies, and added health-floor gates so future breakage fails the nightly build instead of degrading invisibly.
- Shipped and secured the full subscription lifecycle on a 6-table Postgres schema: Stripe Checkout with trial, signature-verified webhooks, Customer Portal, Clerk auth, scheduled delivery, hashed-IP daily quotas on the unauthenticated endpoint, 51 tests, and CI.
- Chose keyword pre-filter plus LLM re-rank over vector embeddings: in a structured domain at this corpus size it gave better precision with no embedding infrastructure to maintain.

EXPERIENCE

New Jersey Turnpike Authority | Full-Stack Engineer / Data Analyst

Woodbridge, NJ | May 2025 - Present

- Migrated legacy Microsoft Access workflows onto three internal web applications now used daily by hundreds of employees across 3 departments: network topology mapping 500+ enterprise devices, certificate-of-insurance tracking, and operator certification. Timed identical record lookups against the legacy system and measured a 40% reduction in time to answer.
- Designed and built the production PostgreSQL schema now holding 20,000+ rows, and the dashboards on top of it: MUI DataGrid Pro with server-side pagination and sorting, typed forms via react-hook-form and Zod, file upload through Next.js server actions, and PDF export with `@react-pdf/renderer`.
- Cut topology page load time from 2.4s to under 500ms by adding composite indexes on device-relationship tables and rewriting two N+1 join patterns in Drizzle queries.
- Built CSV ingestion and transformation pipelines, plus Python and Node services for scheduled ETL, network monitoring, and directory automation through the Microsoft Graph API, eliminating 10+ hours of weekly manual work.
- Implemented role-based access control and Playwright end-to-end tests across the critical CRUD, filter, and export paths. Applications deploy behind nginx on internal infrastructure; changes ship through PR review with QA and DevOps sign-off.

SKILLS

Languages: TypeScript, JavaScript, SQL, Python

AI / LLM: Claude API, tool use with schema validation, prompt design, cost and latency tuning, Claude Code, Cursor

Web: React, Next.js (App Router, route handlers, server actions), Tailwind CSS, Material UI, MUI DataGrid Pro, Zod

Data & Infra: PostgreSQL, Drizzle ORM, Neon, query optimization and indexing, nginx, Docker, Vercel, GitHub Actions, Playwright

EDUCATION

Rutgers University, New Brunswick | B.S. Computer Science | May 2025
